SA-JAS

A job agent suite that never presses Submit

YEAR	ROLE	TEAM	STATUS
2026	Product, desktop engineering, agent design	Solo build	Live

Summary

A desktop suite where three AI agents find real South African vacancies, tailor an application for each role and drive a visible browser copilot, always leaving the final Submit to the person.

The problem

Applying for work in South Africa is a fragmented, repetitive job. Listings live across a dozen boards, each application asks for the same information in a different shape, and the advice online is written for a different market.

SA-JAS treats the application as a pipeline with three agents and one hard boundary. The agents can search, tailor and fill. They cannot submit, solve a CAPTCHA or hide what they are doing.

What is built

- Job Hunter: Claude grounded web search returns real vacancies with source URLs, backed by 12 SA job-board scrapers and AI link validation and repair.
- Document Tailor: an ATS-optimised CV and a 300–400 word cover letter per role in SA English, rendered to PDF.
- Apply Copilot: a per-page AI planner, vision fallback, three-pass smart-fill and a learn-as-you-go answer bank. It never auto-submits, never solves CAPTCHAs and scans pages for prompt injection.
- Evolving candidate memory with “Dreaming” curation, scheduled Routines, opt-in Anthropic computer-use form filling, parallel sub-agents, a referral pipeline and cost controls (usage ledger, daily budget guard).

Decisions that matter

Never press Submit

Choice. The copilot fills forms but leaves the final action to the applicant.

Why. The person keeps agency over every application.

Trade-off. One manual step per application.

A visible browser

Choice. The copilot drives a browser the user can watch.

Why. The work stays inspectable and debuggable.

Trade-off. Visible automation is slower than headless.

Real listings, checked links

Choice. Twelve South African boards feed grounded search and every link is validated.

Why. No invented vacancies.

Trade-off. Scrapers break and need repair.

Stack

`Electron` `React` `Express` `Playwright` `Claude` `Gemini`
